

Feathers

**Chameleon®
Feather Contact
Points -
The best of the
best!**

Manual to install your feathers:

1. Unscrew two of the three plastic plugs on a Chameleon® island. Install the Chameleon® Cylinders on your Chameleon® when there are none.

*Small cylinders
included with your
package fit easily into
the holes in each
island.*

2. Install your feathers using the enclosed plastic 6mm screws. The feathers should angle out to the outside of your Chameleon®.

3. You can work with single contact with insensitive dogs. This can be done side by side or parallel to each other (our preferred set up). If you set up your feathers in a single parallel fashion, be certain to set up the feathers such that one is on a negative island and one is on a positive island.

4. You can work with double contact for more sensitive dogs. The more feathers you use, the milder the sensation of stimulation.

5. Make sure that the plastic plugs are snug. After switching on your collar, the Chameleon® will go in contact mode for about two minutes. If this is not the case (and you have changed nothing with Emily), contact your service centre as soon as possible. Double check the contact measurement by putting your fingers on opposite poles. This will verify that your plugs are snug and that your feathers are making contact and that you will have smooth and stable stimulation.

Feather Contact Points:

These feathers are specially designed to make better contact with the skin of your dog than you already had with the contacts you had on your Chameleon®. This design will always push for contact with the skin of your dog if (of course) your collar is snug enough. The contact surface of the feather contact point is designed in such a way that even if the contact point makes a little bit more pressure with the skin, this will not make the contact with the skin surface bigger like other contacts do. Due to that, the resistance of the skin stays the same with the Feather contacts. This means that the skin sensation will also stay the same. This together with the SSC is a double security (electronic and mechanical security) to control stable sensation. As you also can see, the fur of the dog can find a way through the feathers, so the fur is not blocking the contact away from the skin. The point is: one size fits all type of furry dogs—short hair, long hair, curly hair, stiff hair, dirty hair... Also, there is no edgy contact surface on the feathers so that you minimalist necrosis. The feathers are designed so they flex like springs and seek ideal constant pressure. This dynamic duo of the springs and the perfect fit collar makes the contact and the collar always flexible and optimal if the collar is snug enough. The feathers are under the patent of Michael and Bart Bellon (U.S. Patent 8,783,212 B2 and EP Pending) and are only legal and compatible with the Chameleon® product.

The feathers are made from spring stainless steel. They normally will take back their normal shape unless there is extreme accidental abuse on the feathers. If the feathers break frequently, we recommend to use normal contact point included with your Chameleon® set.
